Preface

This Dictionary is intended to provide an easy-to-use reference source for all scientists working with carbohydrates on a regular or occasional basis. It represents a much enlarged and revised new edition of the dictionary first published in 1998, which in turn was an expansion of the earlier title *Carbohydrates* (chemistry sourcebook series) (1987). The previous edition was welcomed by carbohydrate researchers and has been found to be of considerable practical use and it is therefore anticipated that this new edition, with its numerous improvements in response to users' comments, will be equally welcomed.

Compared with the previous volumes, the number of compounds included has been substantially increased, while at the same time the presentation has been sharpened. A further careful review of the coverage was carried out so that the best possible selection of the parent sugars and their derivatives could be made. A number of entries present in the previous compilation for antibiotic and other natural product types in which the sugar component is not central to the structure have been omitted. Despite these deletions, the extensive compilation of further important carbohydrate compounds means that the total number of compounds included is now 24,000.

The vast majority of references given for each entry are now labelled to indicate their content, particularly in respect to their derivative(s) that they document. In general, therefore, the Dictionary takes the user straight from the entry to the correct literature citation for the compound, eliminating several steps compared with a literature search carried out by other routes.

Carbohydrate science is no longer seen as a specialised subdivision of organic chemistry, but as a discipline of central importance to the chemical and biological sciences. Every attempt has been made in the coverage of the Dictionary to provide all glycoscientists, not just synthetic carbohydrate chemists, with the key information that they will need for their day-to-day work.

The *Dictionary of Carbohydrates* is published as a book with a CD-ROM. The CD-ROM version has a number of benefits compared to the book. Users already familiar with other titles in the Chapman & Hall series will find the CD-ROM uses the same familiar interface, but even those with no previous experience will find the CD-ROM intuitive to use.

Introduction

1. COVERAGE

The *Dictionary of Carbohydrates* covers the following classes of compound.

(1) **The parent monosaccharides and their important derivatives.** All of the fundamental aldoses and ketoses are extensively documented. The coverage of their derivatives is extensive although not of course comprehensive. Entries have been compiled to present a wide range of derivatives of most interest in synthetic carbohydrate chemistry, including a good selection of those containing the more recently developed blocking groups.

Sugars differently derivatised at several functional groups are common in carbohydrate chemistry and these are presented as 'derivatives of derivatives', sometimes branching off into their own entries (see below).

(2) **Modified monosaccharides.** Compounds such as halodeoxy-, aminodeoxy-, thio- and anhydrosugars, glycuronic acids, etc. are covered extensively.

(3) **Disaccharides.** The coverage of disaccharides derived from two unmodified sugar residues is virtually complete. There is selective coverage of modified disaccharides (e.g. aminodeoxysucroses).

(4) **Tri-, oligo- and polysaccharides.** The coverage of these has also been increased and concentrates on those with biochemical significance and/or industrial usage.

(5) **Alditols and cyclitols.** These are extensively documented along with their most important derivatives.

(6) **Nucleosides.** The number of these included has been considerably increased. The coverage centres on naturally occurring nucleosides such as those found in RNA, their analogues and other nucleosides with pronounced drug activities.

(7) **Glycoside antibiotics and related compounds.** An up-to-date coverage of these is given.

(8) **Other glycosides.** Some natural products containing markedly unusual sugars or unusual glycosidic linkages are included. A very large number of plant and animal glycosides is now known, and for comprehensive coverage of these the user is referred to the *Dictionary of Natural Products* website (www.chemnetbase.com) or CD-ROM. The glycosinolates are covered.

In compiling the printed version and the CD-ROM, the primary literature has been reviewed up to late 2004.

2. ORGANISATION OF ENTRIES

The Dictionary is arranged alphabetically by entry name. Every entry is numbered to assist ready location. Many compounds are included as derivatives of main entry compounds but important derivatives have their own individual cross-referenced entries. Use of the indexes enables the rapid location of all compounds in the Dictionary by name or compound type, regardless of their location.

In most cases the stereoisomeric and ring-form (i.e. pyranose/furanose) variants of a given carbohydrate are included in the same entry, with a few exceptions (for example, glucoseptanose has its own entry).

The organisation of the entry for a typical important monosaccharide therefore follows the following scheme:

Entry Compound

D-form

Derivatives generally applicable to the D-form (e.g. derivatives of the open chain form)

D-Pyranose-form

Derivatives not specifically assigned to either the α - or β -anomer

α -D-Pyranose-form

Derivatives

β -D-Pyranose-form

Derivatives

D-Furanose-form

Derivatives not specifically assigned to either the α - or β -anomer

α -D-Furanose-form

Derivatives

β -D-Furanose-form

Derivatives

L-form

etc.

A representative dictionary entry is shown in Fig. 1.

2.1 CHEMICAL NAMES AND SYNONYMS; NOMENCLATURE OF CARBOHYDRATES

The Dictionary contains a wide range of synonyms which may be (a) those found in the primary literature, (b) *Chemical Abstracts* names, or (c) names added editorially to achieve as much consistency as possible with other closely related substances. Names corresponding to those used by CAS during the 9th and subsequent Collective Index periods (1973-) are

labelled 9CI (there have been no substantial changes in CAS nomenclature for most carbohydrates since 1973). Names used during the 8th Collective Index period (1967-1972) are labelled 8CI. All important derivatives embedded within entries are named (but see comment on CAS nomenclature below).

If a compound cannot be located immediately in the main body of the entries, it is important to use the indexes.

The most authoritative current statement of good practice on carbohydrate nomenclature is the document *IUPAC/IUBMB Joint Commission on Biochemical Nomenclature of Carbohydrates Recommendations*, (*Pure Appl. Chem.*, 1996, **68**, 1919) the full text of which can be read on the Dictionary of Carbohydrates CD-ROM (access from the Windows® Start menu item or via the Help menu in the main program).

For the majority of carbohydrates documented in the dictionary there is full agreement between the IUPAC/IUBMB recommendations and current practice by the vast majority of authors active in carbohydrate science, and therefore no difficulty in deciding on the entry name for the majority of compounds in the Dictionary. However, a number of complications arise at a more detailed level.

(1) The complexity of the names of carbohydrate derivatives containing a variety of different substituents means that trivial errors in naming them according to the correct IUPAC alphabetical rules are quite widespread in the primary literature. In general, these errors have been corrected in the Dictionary and the incorrect versions are not given as synonyms.

(2) IUPAC rules for nomenclature of a few types of carbohydrate contain certain features that differ from those for general organic compounds. For carbohydrates which do not possess a functional group to receive the locant 1 such as alditols, two names are possible. In such cases precedence is given to the name deriving from the parent structure coming *first in alphabetical order*, then to assignment to the *D-* rather than *L-series*; these rules take precedence over the usual IUPAC numbering principle of lowest possible locants (rule 2-Carb-2-1-3). This is illustrated by the following examples.

The rule can lead to names which are less than user friendly. *D*-Galactal, for example, is 2,6-anhydro-5-deoxy-*D*-*arabino*-hex-5-enitol rather than 1,5-anhydro-2-deoxy-*D*-*lyxo*-hex-1-enitol which is more intuitive and would be the choice of workers in the field (in the Dictionary all three names are quoted).

Not all authors follow strict IUPAC principles. In this Dictionary the policy has been to follow IUPAC in the choice of the entry name for the compound, but to give the 'incorrect' forms as synonyms. Such entries are often given notes explaining the nomenclature situation with a view to eliminating as much confusion as possible.

(3) The -CHO (or potential CHO) group in aldoses (but *not* the CO group in ketoses) takes numbering precedence over any other group in the molecule, including groups such as -COOH which in general organic nomenclature are senior to -CHO .

(4) Complexities arise at the interface between carbohydrate and aliphatic chemistry, where it is frequently possible to name compounds either as modified sugars or as aliphatic structures such as lactones or furans. The transition between the two systems is not rigidly defined by IUPAC and compounds treated in *Chemical Abstracts* as sugars may be named by other authors as aliphatic compounds, and vice-versa. The numbering scheme invariably changes and so does the preferred system for

denoting configurations, meaning that great care is necessary to avoid errors. The following example is typical:

In this Dictionary, compounds containing three or more chiral centres are usually named and numbered as carbohydrates, while the majority of compounds containing one or two chiral centres are named and numbered as aliphatics¹. The alternative schemes are usually given as synonyms.

(5) Although Chemical Abstracts names for carbohydrates follow IUPAC principles, the CAS names for some common groups found in carbohydrate derivatives do not correspond to those used by the majority of carbohydrate chemists as given in this Dictionary. For example;

<i>Dictionary name</i>	<i>CAS name</i>
Isopropylidene	1-Methylethylidene
Benzylidene	Phenylmethylene

In the majority of cases, the CAS alternative is not given as a synonym in the Dictionary entry.

2.2 CAS REGISTRY NUMBERS

CAS numbers are identifying numbers allocated to each distinctly definable chemical substance indexed by CAS since 1965 (plus some retrospective allocation of numbers by CAS to compounds from earlier index periods). The numbers have no chemical significance but they provide a label for each substance independent of any system of nomenclature. They are extensively used for exchanging information between individuals and databases. The numbers take the form NNNNNN-NN-R, where the total number of digits is five or more and R is a check digit.

For practical purposes, CAS numbers have certain shortcomings arising from their free allocation, resulting in one substance having more than one potential number. Duplication may arise for one of several reasons to do with the detailed chemistry of the substance, for example tautomerism, solvent formation, partially unspecified stereochemistry. There are also replaced numbers. For this reason, Carbohydrates entries will often contain one or more *Additional CAS numbers* which may help the user to obtain further information about the substance, especially by online searching.

Clearly, the additional CAS numbers given in Carbohydrates have to be used with care. Their inclusion in the entry is the result of an editorial decision by the Carbohydrates contributor that they refer to what is essentially the same substance, but this decision may be a subjective one. Care has been taken

to ensure that the main CAS number given in Carbohydrates for each substance is the correct one.

Further information on CAS number allocation policy can be obtained from CAS indexes or *The Organic Chemist's Desk Reference*.

2.3 STRUCTURAL FORMULAE

Every attempt has been made to present the structures of chemical substances as accurately as possible according to best current practice and recommendations of IUPAC (The International Union of Pure and Applied Chemistry). As much consistency as possible has been aimed at between closely-related structures. For example, all sugars are shown as Haworth formulae, and whenever possible in complex structures the rings are oriented in the standard Haworth convention so that structural comparisons can be quickly made.

2.4 MOLECULAR FORMULA AND MOLECULAR WEIGHT

The elements in the molecular formula are given according to the Hill convention (C, H, then other elements in alphabetical order). The molecular weights given are formula weights (or more strictly, molar masses in daltons) and are rounded to three places in decimals. In the case of some high molecular mass substances, such as proteins, the value quoted may be that taken from an original literature source and may be an aggregate molar mass.

2.5 PHYSICAL DATA

Carbohydrates gives the following physical characteristics of substances, when available; appearance, melting point, boiling point, optical rotation, density, refractive index, solubility, pKa. All of these fields are searchable by numerical value (including range searching) in the CD-ROM version of Carbohydrates.

2.5.1 Appearance

Organic compounds are considered to be colourless unless otherwise stated. Where the compound contains a chromophore which would be expected to lead to visible colour, but no colour is mentioned in the literature, the Carbohydrates entry will mention this fact if it has been noticed by the contributor. An indication of crystal form and of recrystallisation solvent is often given but these are imprecise items of data; most compounds can be crystallised from several solvent systems and the crystal form often varies. In the case of the small number of compounds where crystal behaviour has been intensively studied (e.g. pharmaceuticals), it is found that polymorphism is a very common phenomenon and there is no reason to believe that it is not widespread among organic compounds generally.

¹ Lichtenthaler, F.W., *et al.*, *Annalen*, 1989, 1153

2.5.2 Melting points and boiling points

The policy followed in the case of conflicting data is as follows:

- Where the literature melting points are closely similar, only one figure (the highest or most probable) is quoted.
- Where two or more melting points are recorded and differ by several degrees (the most likely explanation being that one sample was impure) the lower figure is given in parentheses, thus Mp 139° (134-135°).
- Where quoted figures differ widely and some other explanation such as polymorphism or incorrect identity seems the most likely explanation, both figures are quoted without parentheses, thus Mp 142°, Mp 205-206°.
- Known cases of polymorphism or double melting points are noted.

Boiling point determination is less precise than that of melting points and conflicting boiling point data is not usually reported except when there appears to be a serious discrepancy between the different authors.

2.5.3 Optical rotations

These are given wherever possible, and normally refer to what the Carbohydrates contributor believes to be the best characterised sample of highest chemical and optical purity. Where available an indication of the optical purity (op) or enantiomeric excess (ee) of the sample measured follows the specific rotation value.

Specific rotations are dimensionless numbers and the degree sign which was formerly universal in the literature has been discontinued.

2.5.4 Densities and refractive indexes

Densities and refractive indexes are now of less importance for the identification of liquids than has been the case in the past, but are quoted for common or industrially important substances, or where no boiling point can be found in the literature.

Densities and refractive indexes are not quoted where the determination appears to refer to an undefined mixture of stereoisomers.

2.5.5 Solubilities

Solubilities are given only where the solubility is unusual for a compound. Typical organic compounds are soluble in the usual organic solvents such as ether and chloroform, and virtually insoluble in water. The presence of polar groups (OH, NH₂, and especially COOH, SO₃H and NR₃⁺) increases water solubility.

2.5.6 pK_a values

pK_a values are given for both acids and bases. The pK_b of a base can be obtained by subtracting its pK_a from 14.17 (at 20°) or from 14.00 (at 25°).

2.6 SPECTROSCOPIC DATA

Many Carbohydrates entries include ultraviolet spectra which are presented in the format:

[neutral] λ_{max} 198 (log ε 1.55); 224 (sh) (log ε 0.61);
241 (sh) (log ε 0.55) (H₂O) (Berdy)

where ε is the absorption coefficient for a given UV maxima value (λ_{max}). A description of the solvent conditions used, if reported in the literature, is listed at the beginning and end of the UV data in parentheses. All peak absorptions cited are maxima unless otherwise described, e.g. shoulder/inflection (sh) and end absorption (end). In addition, UV data may be followed by the term 'Berdy' or 'DEREP' indicating from which database the data originated. The absence of either of these terms implies that the data was abstracted from the primary literature.

On the CD-ROM, all the λ_{max} values are indexed in the UV Maxima field and can be searched for numerically including range searching. Similarly, the solvent data associated with the UV data are indexed in the UV Solvent field.

2.7 HAZARD AND TOXICITY INFORMATION

2.7.1 General

Toxicity and hazard information is highlighted by the symbol ► and has been selected to assist in risk assessments for experimental, manufacturing and manipulative procedures with chemicals.

Physical, *reactive* and *toxic* properties all contribute to the hazard associated with a particular chemical. As part of the *physical data*, flash points, explosive limits and autoignition temperatures have been included where appropriate. Flammable classifications, which are based on flash point measurements and boiling points, are also mentioned, and the opportunity has been taken to include UK occupational exposure limits, or for some compounds threshold limit values published by the American Conference of Governmental Industrial Hygienists (ACGIH). For the *reactive* hazards, a brief comment is made on any explosive (or violent polymerisation) properties and aspects of the chemical reactivity of a substance which are of concern. These include the potential for peroxidation, oxidising/reducing properties and incompatibility with commonly available chemicals. *Toxicity* information has been chosen to show hazardous effects from short-term or long-term

exposure. Observations from human exposure are summarised if available (including possible adverse effects of drugs), otherwise experimental (exp.) tests are quoted. Included in the toxicity data are the results of irritancy tests, acute lethality data, target organ toxicity, and carcinogenic and reproductive properties where appropriate. Those chemicals which have been classified by the International Agency for Research on Cancer (IARC) as *human carcinogens*, *probable human carcinogens* or *possible human carcinogens* have been identified in Carbohydrates accordingly.

The Publishers cannot be held responsible for any inaccuracies in the reported information, neither does the omission of hazard data in the *Dictionary* imply an absence of this data from the literature. Widely recognised hazards are included however, and where possible key toxicity reviews are identified in the references. Further advice on the storage, handling and disposal of chemicals is given in *The Organic Chemist's Desk Reference*.

Finally, it should be emphasised that any chemical has the potential for harm if it is carelessly used.

2.7.2 RTECS® Accession Numbers*

Many entries in Carbohydrates contain one or more RTECS® Accession Numbers. Possession of these numbers allows users to locate toxicity information on relevant substances from the NIOSH *Registry of Toxic Effects of Chemical Substances*, which is a compendium of toxicity data extracted from the scientific literature.

For each Accession Number the RTECS® database provides the following data when available: substance prime name and synonyms; data when the substance record was last updated; CAS Registry Number; molecular weight and formula; reproductive, tumorigenic, and toxic dose data; and citations to aquatic toxicity ratings, IARC reviews, ACGIH Threshold Limit Values, toxicological reviews, existing Federal standards, the NIOSH criteria document program for recommended standards, the NIOSH current intelligence program, the NCI Carcinogenesis Testing Program, and the EPA Toxic Substance Control Act inventory. Each data line and citation is referenced to the source from which the information was extracted.

2.8 BIBLIOGRAPHIC REFERENCES

The selection of references is made with the aim of facilitating entry into the literature for the user who

wishes to locate more detailed information about a particular compound. The contents of most references are indicated by reference tags (suffixes) indicating their content and in particular the stereoisomers and derivatives of the parent compound which they document. Many carbohydrates are documented in several different literature references, and unless there are marked differences in their reported physical properties or syntheses, recent and accessible references are preferred to older and/or less accessible ones. The number of references cited does not indicate the relative importance of a compound; one key recent citation may supersede a number of older ones.

Journal abbreviations generally follow the practice of the Chemical Abstracts Service Source Index (CASSI), except for a short list of very well known journals where the Dictionary gives shorter abbreviations to save space (e.g. *J.A.C.S.* instead of *J. Am. Chem. Soc.*)

2.8.1 Further References

Further useful information on a variety of topics concerned with the structure, description, stereochemistry and nomenclature of organic compounds, including carbohydrates can be found in the *Organic Chemist's Desk Reference* (Chapman & Hall, 1995).

3. INDEXES

There are two printed indexes:

- (1) A **Name Index** which lists every compound name and synonym in the Dictionary, and
- (2) A **Type of Compound** index listing all compounds given in the Dictionary.

The indexes refer to the entry number. In the Name Index an entry number preceded by the word 'see' means that the name listed is a synonym to an entry name, and appearance of the term 'in' means that the name listed is the name of a derivative embedded within the entry.

Searches on all text and numerical indexes, as well as structure and substructure searching can be carried out on the CD-ROM version of the Dictionary. In the CD-ROM Type of Compound Index, all carbohydrates in the Dictionary are classified under one or more of the headings given in Fig. 2.

* RTECS® Accession Numbers are compiled and distributed by the National Institute for Occupational Safety and Health Service of the U.S. Department of Health and Human Services of The United States of America. All rights reserved (1996)

5. DICTIONARY OF CARBOHYDRATES ON CD-ROM

The *Dictionary of Carbohydrates* is published together with a fully searchable CD-ROM. Space considerations have precluded the inclusion of indexes other than the Name Index and the Molecular Formula index in the hard-copy version of The *Dictionary of Carbohydrates*. These were considered to be the most useful types of indexing for users primarily wishing to locate carbohydrates. In contrast, the CD-ROM contains searchable indexes on the following 33 fields:

Accurate Mass	Molecular Formula
All Entries	Molecular Weight
All Text	Optical Rotation
Biological Source	Partition Coefficient (Calc.)
Biological Use/Importance	Percent Composition
Boiling Point	References
Boiling Point Pressure	Refractive Index
CAS Registry Number	Rotation Conditions
Chapman & Hall Number	RTECS Accession No.
Chemical Name	Source/Synthesis
Density	Supplier
Development Status	Type of Compound
Dissociation Constant	Type of Compound Words
Hazard & Toxicity	Use/Importance
Hazard Flag	UV Maxima
Ion Charge	UV Solvent
Melting Point	

In addition to searching the above text fields, it is possible to search on structure and substructure.

Once installed, a User manual and Help file providing additional information on data content and guide to searching are available from the Chapman & Hall CRC folder in the Start Menu and from the Help menu on the CD-ROM.

When accessing the *Dictionary of Carbohydrates on CD-ROM* the first screen that is obtained is the Search Form window (Fig. 3).

The Search Form window is split into three panes:

1. Structure Search pane — allowing structure and substructure searching.
2. Search Terms pane — search from one or more of the 29 available data/text fields.
3. Index pane — displays the indexed terms within a selected field.

From the Search Form window design your search profile using text, structure or text/structure searching. Once your search has been performed the resultant hits are listed alphabetically by chemical name in the Hit List screen. Clicking on any one of the hits in the hit list screen will result in that entry being displayed in the Entry Display screen (Fig. 4).

Any comments and suggestions for inclusion may be sent to:

9CI, 8CI
[7264-19-9]

α-Pyranose-form

C₁₂H₂₀O₁₂ 356.283

Probably the commonest aldobiouronic acid present as a structural unit in plant gums. Isol. from partial acid hydrolysates from the following plants; black wattle (*Acacia mollissima*), *Acacia senegal*, *Acacia pycnantha*, *Acacia karroo*, *Acacia cyanophylla*, egg plum (*Prunus domestica*), almond (*Prunus amygdalus*), peach (*Prunus persica*), *Anogeissus latifolia* (gum ghatti), *Vigilia oroboides*, *Afraegle paniculata*, *Ferula* and *Chorisia* spp. Also isol. from hydrolysates of maritime pine (*Pinus pinaster*) hemicellulose and wheat straw. Mp 118-119° (hydrate). [α]_D +11.6 → -8.6 (H₂O).

Ca salt: [α]_D +2 (H₂O).

Ba salt: [α]_D -3 (H₂O).

Carrisin. Polymannoacetate

[110042-95-0]

Long chain polymer consisting of linear (1 → 4)-D-mannopyranosyl units, randomly acetylated (0.8 Ac per monomer) MW >10000 Dalton. Constit. of leaf juice of *Aloe barbadensis* and *Aloe arborescens* (Liliaceae). Biol. active component of carrisin extract (73-90%). Potent inducer of Interleukin 1 and Prostaglandin E₂ production by human peripheral blood adherent cells *in vitro*. Influences activity and production of T-lymphocytes, fibroblasts, B-lymphocytes and endothelial cells. Adjuvant and immunoenhancer. Increases antibody production, stimulates phagocytosis. Shows specific antineoplastic activity against sarcoid tumours in horse. Used in the treatment of inflammatory bowel disease. Fluffy amorph. powder.

5-(Acetylamino)-3,5-dideoxy-D-glycero-D-galacto-2-nonulosonic acid, 9CI. O-Sialic acid. **Aceneuramic acid**, INN. Lactaminic acid. Gynaminic acid. Serolactaminic acid. KI 111. NANA. Neu5Ac. Neu5NAc [131-48-6] α -D-Pyranose-form $C_{11}H_{19}NO_9$ 309.272

See also Sialic acids, S-37. Isol. from eggs, milk, colostrum, submaxillary mucin and meconium by acid or enzymic hydrol. of the constit. sialoproteins and oligosaccharides. Present in urine of patients with sialuria. Most abundant source is Collocalia mucoid, the nest cementing glycoprotein substance of the Chinese Swiftlet. Chiral synthon. Anti-inflammatory, antiviral and antitussive agent. Involved with blood protein half-life regulation, bacterial adhesion, toxin neutralisation, glycoprotein lytic protection.

Strictly the name Ademetionine refers to the (S)-form. Metab. intermed. which functions as the principal biological donor of methyl groups, as the source of the propylamine moieties of spermidine and spermine, and as the regulator of a variety of enzymatic reactions. Metabolic; used to treat hepatic disorders. Also under investigation as an antidepressant, and for the treatment of osteoarthritis.

Agar-agar. Gum agar. Gelose. Japan agar. Bengal isinglass. Ceylon isinglass. Chinese isinglass. Japan isinglass. FEMA 2012. E406

[9002-18-0]

See also Agarose, A-61. Consists of a mixt. of 2 polysaccharides, Agarose A-61 and Agarpectin, which has essentially the same struct. except that a variable proportion of the sugars in the polymer are replaced by 4,6-O-(1-carboxyethylidene)galactose or by sulfated or methylated sugar residues such as to retain the alternating sequence of 3-linked β-D- and 4-linked α-L- units. Mucilaginous substance extracted from red marine algae (Rhodophyceae); *Gelidiella acerosa*, various *Gelidium* spp. *Gracilaria*

confervoides, *Pterocladia capillacea* and *Pterocladia lucida* are used in various parts of the world. There is some species variation in gel structure and strength. An important thickener, stabiliser and gelling agent in the food industry. Also used as protective colloid in photo-metric detn. of Sn, Mg, Si, SO₄²⁻. Solid medium for the cultivation of bacteria. Laxative-cathartic. Strips or fine powder. Sl. sol. in hot H₂O.

Agarose

Neutral agarose. Indubiose A4
[9012-36-6]

[9036-61-7]

See also Agar, A-59. Composed of repeating units of β -D-Galp (1 \rightarrow 3), 3,6-anhydro- α -L-Galp (1 \rightarrow 3). Has a domain struct. of double helices aggregating into a three-dimensional framework holding water molecules. Isol. from red seaweed agar (*Gelidium* spp.). Gives gels of high strength at low concs. in water which are nearly transparent. These are used commercially as gelling agents and for biomedical applications, e.g. electrophoresis media, chromatography and immunology assays.

There are two other polysaccharides in agar, one is similar to agarose but with 4,6-acetals of pyruvic acid at some of the D-galactose units. The other contains fewer 3,6-anhydro-L-galactose units and is sulfated.

Alginic acid, BAN

A-71

Gum levan. Levan gum. Kelacid. Norgine. Sazio. E400 [9005-32-7]

[C₆H₈O₆]

A polymer consisting of various proportions of β-D-Mannuronic acid and α-L-Guluronic acid linked 1→4 and arranged in a block fashion. Polymeric. Minimum formula given. Occurs as the major matrix polysaccharide in brown seaweed (Phaeophyceae) as an insol. complex of K, Na, Ca and Mg alginates. Alginates are used to improve food texture, e.g. in ice cream, pie fillings. Used in tablet disintegrants and paper coatings. Food additive: emulsifier, stabiliser, thickener. Pharmaceutical aid for preparation of water-miscible pastes, creams and gels. Co-administered with antacid or H₂-receptor agonist for management of gastro-oesophageal reflux. [α]_D -120 (as Na salt in H₂O). Approx. 200 grades of the acid and its salts (ammonium, Ca, K, Na) com. available. Alginates with the highest guluronic acid content display the strongest gel-forming activity.

C₆H₁₃NO₅ 179.172**D-form**

Glucosamine, 9CI, 8CI. Chitosamine [3416-24-8]

Present in mucopolysaccharides and in polysaccharides found in bacteria, fungi, higher plants, invertebrates, vertebrates, antibiotics and UDP complexes. Obt. comly. by hydrol. of seashells. Inexpensive starting material for synthesis. Antiarthritic agent. pK_a 7.75 (24°).**► LZ6664000****3-Sulfate:**C₆H₁₃NO₈S 259.237Monohydrate. 1,5-Anhydro-arabino-hex-2-ulose

 $C_6H_{10}O_5$ 162.142

In aq. soln. the oxo form ill. is in equilib. with the 2-enol form, the 2,3-enediol form and the 3,3-diol covalent hydrate, which is the predominating species. In nonaqueous solvs. exists as a mixt. of two dimers. Acetylation gives spiro-dimers.

D-form [75414-43-6]

Prod. by the action of α -1,4-glucan lyase on α -glucans such as starch. Exists in rat liver, fungi and algae. Precursor of 2-Hydroxy-2-(hydroxymethyl)-2H-pyran-3(6H)-one in *Morchella vulgaris* (morel) and of Echinospurin in *Peziza echinospora*. Antioxidant.

[32609-14-6]

A highly branched polysaccharide composed of L-Arabinose, D-Galactose, L-Rhamnose and D-Gluconic acid in an approximate 3:3:1:1 ratio. Salt-free polysaccharide formed by precipitation from an acidified soln. of gum arabic.

Mixed salts: Gum arabic. Australian gum. Acacia gum. Wattle gum. E414. FEMA 2001

[9000-01-5]

The dried gummy exudate from the stems and branches of *Acacia senegal* and other *A.* species. Used as protective colloid to prevent settling of ppts. in some photometric and turbidimetric detns.

Yellowish-amber lumps. Dissolves slowly in H₂O.

Carrageenan**C-28**

Carrageenin. Carragheen. Genuvisco J. FEMA 2596. E407
 [9000-07-1]

A complex mixt. of polysaccharides composed of galactans, the proportions of which vary with spp., season and environment. The major structural feature is $\beta(1 \rightarrow 3)$ and $\alpha(1 \rightarrow 4)$ linked galactose units with various degrees and sites of sulfation (sulfate ester content 15-40%). The Greek prefixes denote the idealised constitution of different disaccharide units although native carrageenans show variation from these idealised structs. The struct. also varies during life-cycle of the alga. Obt. from red seaweeds in the families Furcellariaceae, Gigartiniaceae, Phyllophoraceae and Solieraceae. Used for gelling, thickening and emulsion stabilisation of foods (salts may also be used). Sol. H_2O ; fairly sol. DMSO; poorly sol. oils, MeOH, hexane. v component also referred to in the lit. alongside those descr. below.

Isol. from *Furcellaria fastigiata*. Structure (1) with $R^1 = R^3 = H$, $R^2 = R^4 = SO_3^-$. Minor fraction of carrageenan samples.

λ-form

Picnin A
[9064-57-7]

Isol. from *Chondrus crispus*. Present particularly in algal tetrasporophytes. Structure (1) with $R^1 = R^3 = R^4 = SO_3^-$, $R^2 = H$. Major fraction.

► FI0704000

ε-form [51311-95-6]

Isol. from *Furcellaria fastigiata*. Structure (1) with $R^1 = R^3 = SO_3^-$, $R^2 = R^4 = H$.

ι-form [9062-07-1]

Isol. from *Eucheuma spinosum* and *Agardhiella tenera* red seaweeds. Structure (2) with $R^1 = H$, $R^2 = SO_3^-$. Major fraction.

κ-form [11114-20-8]

Isol. from *Chondrus crispus*. Present particularly in algal gametophytes. Structure (2) with $R^1 = R^2 = H$. Major fraction.

► FI0703000

ξ-form [70431-33-3]

Isol. from *Gigartina* spp. tetrasporophytes. Structure (1) with $R^1 = R^3 = SO_3^-$, $R^2 = R^4 = H$.

π-form [71078-00-7] Structure (1) with $R^1 = R^3 = SO_3^-$, $R^4 = H$, C_4-C_6 pyruvate bridge in left-hand residue.

υ-form Structure (2) with $R^1 = R^2 = SO_3^-$.

[9004-34-6]

$C_6H_{10}O_5$ 162.142

An unbranched polymer composed of 1,4 β -linked glucopyranose units. Polymeric. Minimum formula given. Native cellulose consists of two different crystal structures, a two-chain monoclinic phase and a single chain triclinic phase. The most abundant organic material found in plants forming the principal constit. of their cell walls giving them structural strength. Cotton is almost pure cellulose. Wood is the most important industrial source. Basic material for textile and paper manuf. Used in the isol. of heavy metals. Anticaking agent, binding agent and other uses in food. Capsule and tablet diluent. Insol. H_2O , most solvs., but forms sol. complexes in conc. aq. $ZnCl_2$, copper-amine solutions and with Fe sodium tartrate solution.

► OES: long-term 10 mg m⁻³ for total inhalable dust; 5 mg m⁻³ for respirable dust. OES: short-term 20 mg m⁻³ for total inhalable dust. Reacts vigorously with oxidants. FJ5691460

Poly-O-sulfate: Cellulose sulfate. Usher cell [9032-43-3] Used in food thickeners, textile sizes and viscosity modifiers for oil-drilling muds. Excipient. Microbicidal gel for prevention of HIV and sexually transmitted diseases. Contraceptive. Sol. H_2O .

- Poly-O-phosphate, Na salt:** *Cellulose sodium phosphate, USAN. Calcisorb. Calcibind* [9038-41-9]
[9015-14-9] Flameproofing treatment for cotton. Ion-exchange material. Used for the treatment of kidney stones. Cream powder.
- Poly-O-nitro:** *Nitrocellulose. Collodion cotton. Collodion wool. Colloxylin. Celloidin. Cellulose nitrate. Guncotton. Nitron. Parlodion* [9004-70-0] Used in explosives (propellants), lacquers, adhesives, plastics (e.g. Celluloid).
Propellant grade nitrocellulose consists mostly of 2,3,6-trinitro residues with smaller amts. of di- and mononitro residues.
- **Highly flammable**, fl. p. 13°, autoignition temp. 160-170°. Subject to degradation on storage leading to fire and explosion. QW0975180
- Xanthate:** *Cellulose xanthate* [9032-37-5] Used in manuf. of viscose rayon.
- Per-Ac:** *Cellulose acetate, 9CI* [9004-35-7]
[9012-09-3, 9035-69-2] Prepared by acetylation of cellulose with acetic anhydride/acetic acid in the presence of sulfuric acid. Acetylation is normally carried out fully to produce a product known as primary acetate, which approaches the triacetate stoichiometry, and which may then be partially hydrolysed to secondary acetate (DS value 2.2-2.5). Used in manuf. of textile fibres, cigarette filters and lacquers, including photographic films. World production 740000 t in 1987.
Flake or powder. Mp 306° (triacetate form). $[\alpha]_D^{25}$ -20.9 (CHCl₃) (as triacetate).
- Perpropanoyl:** [9004-48-2]
Mp 234° (shrinks at 229°). $[\alpha]_D^{25}$ -19 (c, 1 in CHCl₃).
- Polybutanoyl:** *Cellulose butyrate* [9015-12-7] Used in manufacture of lacquers, films and fibres. Mp 183° (shrinks at 178°). $[\alpha]_D^{25}$ -15.7 (c, 1 in CHCl₃). Phys. props. are for the fully esterified form.
- Poly(Ac, propanoyl):** *Cellulose acetate propionate. Tenite propionate™. Cellidor CP™* [9004-39-1] Produced by esterification of cellulose with mixed anhydrides of acetic and propionic acid in the presence of H₂SO₄. Available commercially in a wide variety of forms varying from 3 to 8% acetic acid content and 55 to 65% propanoic acid content. Thermoplastic moulding material.
Flakes or powder.
- Poly(Ac, butanoyl):** *Cellaburate, INN, USAN. Cellulose acetate butyrate. Cabufocon. CAB* [9004-36-8] Thermoplastic. Used in extrusion and injection moulding, and in lacquers for protective coatings.
- Poly(Ac, phthaloyl):** *Cellacefate, INN. Cellulose acetate phthalate* [9004-38-0] Used as film coating for tablets and capsules. Prac. insol. H₂O, EtOH; sol. Me₂CO.
- Per(phenylcarbamoyl):** [9047-07-8] Chiral stationary phase for resolu. of enantiomers by hplc.
Yellowish solid. Sol. Me₂CO. $[\alpha]_D^{25}$ -100 (CHCl₃).
- Per(3,5-dimethylphenylcarbamoyl):** [103938-44-9] Synth. from cellulose and 3,5-dimethylphenyl isocyanate. Chiral stationary phase for resolu. of enantiomers by hplc. $[\alpha]_D^{25}$ -45.4 (c, 1 in dioxan).
- Per-Me ether:** *Methyl cellulose. FEMA 2696. E461* [9004-67-5] Defoamer, adhesive, thickener and nontoxic food additive. Used as sensitising surfactant in photometric detn. of transition metal ions (with Bromopyrogallol Red). Tablet binder and disintegrant. Veterinary laxative.
- FJ5959000
- Poly-Et ether:** *Ethyl cellulose. Ethocel. Ethylcellulose, INN* [9004-57-3] Prepared by etherification of alkaline cellulose with ethyl chloride. Commercial samples have DS values of 2.2 - 2.7. Annual worldwide production ca. 5000t. Used in hot-melt adhesives and electrically insulating layers and coatings. Binder and coating for pharmaceutical tablets. Binder and coating for pharmaceutical tablets.
Powder or granules. Sol. most org. solvs. Only low DS products (1.3) show significant H₂O solubility.
- Poly-O-benzyl:** *Phenylmethyl cellulose ether* [9015-11-6] Prepared by etherification of alkaline cellulose with benzyl chloride to give a DS value of ca. 2. Developed as a replacement for celluloid in photographic films; has had minor uses as a plastic moulding material. No longer used due to poor thermal and light stability and physical props.
- Poly(carboxymethyl) ether:** *Croscarmellose, BAN, INN. Carboxymethyl cellulose. Carmellose, BAN. Carmellose gum. Cepol. FEMA 2239. E466* [9000-11-7]
[9045-95-8, 9050-04-8] Surfactant. Used as Na salt (Croscarmellose sodium, USAN) to increase the sensitivity of the photometric detn. of Cd, Cu, Mn, Zn with Bromogallol Red. Pharmaceutical aid (tablet disintegrant). Pharmaceutical aid (tablet disintegrant).
Amorph. powder. Sol. H₂O. Mp 300°.
- Exp. reprod. effects. LD₅₀ (rat, orl) 27000 mg/kg. FJ5950000
- Poly(carboxymethyl, Et) ether:** [37205-99-5] Polymer.
- Poly-O-(carboxymethyl, 2-hydroxyethyl):** [9004-30-2] Used in drilling fluids for oil and gas production. Sol. H₂O.
- Poly-O-(2-carboxyethyl):** [9004-42-6] [9032-39-7] Prepared by alkylation of alkaline cellulose with acrylonitrile or acrylamide followed by hydrolysis. Not produced industrially.
- Poly-O-(hydroxymethyl):** *Methylol cellulose* [37353-59-6] Synth. from cellulose and.
- Poly-O-(2-hydroxyethyl):** *HEC Natrasol®, Tylose H®, Cellozise. Cellobond®* [9004-62-0] Prepared by etherification of alkaline cellulose with ethylene oxide. Commercial samples have MS values of 1.8 - 3.5. Worldwide production in 1987 38,500 t. Thickener, binder, stabiliser and suspending agent with widespread uses in the paint, oil and polymer industries.
White-tan powder. Sol. H₂O; insol. org. solvs. High MS products partially sol. in MeOH.
- Poly(2-hydroxyethyl, Me) ether:** *Hydroxyethyl methyl cellulose. HEMC* [9032-42-2] Prepared by etherification of alkaline cellulose with chloromethane and oxirane. Commercial samples have methyl DS values of 1.3 - 2.2 and hydroxyethyl MS values of 0.06 - 0.5. Thickening and binding agent with widespread industrial uses in adhesives, building products, films, wetting agents. Pharmaceutical adjuvant. Better water solubility and electrolyte tolerance than methyl cellulose. Thermally gellable in hot water. Soly. in org. solvs. varies with DS value.
- Poly(2-hydroxyethyl, Et) ether:** *Ethyl hydroxyethyl cellulose. Etulos. EMEC* [9004-58-4] Useful in solvent coating applications, inks, paints and as an additive to cement and gypsum based plasters and mortars. Laxative.
Powder. Sol. hydrocarbons. Insol. EtOH, boiling H₂O.
- Poly(2-hydroxypropyl, Me) ether:** *Hydroxypropyl methyl cellulose. HPMC. E463. Hypromellose, USAN. Hydroxypropylmethylcellulose, JAN. Cellulose hydroxypropyl methyl ether, BAN, INN* [9004-65-3] Prepared by etherification of alkaline cellulose with methyl chloride and propylene oxide. Commercial samples have methyl DS values of 1.1-2.0 and hydroxypropyl MS values of 0.1 - 1.0. Thickening and binding agent with widespread industrial uses in adhesives, building products, films, protective creams and colloids.
Approved for food use in US and EU. Used in deep fried batters. Shows better water solubility and electrolyte tolerance than methylcellulose. Component of artificial tears.
Powder. Sol. H₂O. Thermally gellable in hot water. Sol. in aq. solns. varies with DS value.
- Poly(2-hydroxybutyl, Me) ether:** *HBMC. Methocel HB®* [37228-15-2]
[9041-56-9] Made from alkaline cellulose by etherification with methyl chloride and butylene oxide either stepwise or

simultaneously. Surfactant, gelling agent. Antiredeposition agent for textile washing. Powder. Sol. H₂O, alcohols, glycols. Mp 278-281°.

Poly-(2-methoxypropyl, phthaloyl): [9050-31-1] Coating for controlled release of pharmaceutical formulations.

Poly-O-(2-aminoethyl): 2-Aminoethylcellulose. AE-cellulose [9032-36-4] Substrate for immobilised enzymes in affinity chromatography.

Poly-O-(2-diethylaminoethyl): DEAE-cellulose [9013-34-7] Prepared by etherification of alkaline cellulose with 2-chloroethyl-N,N-diethylamine. Weakly basic ion-exchange material. Widely used as a stationary phase in displacement chromatography of proteins.

Poly-O-(2-cyanoethyl): [9004-41-5] Little commercial significance as such, but low levels of cyanoethylation are used to improve the strength and electrical resistance of speciality cellulose polymers.

Cezomycin

C-52

De(methylamino)calcimycin [83874-22-0]

C₂₈H₃₄N₂O₆ 494.586

Polyether antibiotic. Prod. by *Streptomyces chartreusis* NRRL3882 with added tryptophan. Assists in transportation of calcium across a chloroformic membrane. Shows similar

antibiotic activity to Calcimycin. Poorly sol. hexane.
Mp 75-77°. $[\alpha]_D^{25} +151$ (c, 0.012 in CHCl_3).

3-Hydroxy: 3-Hydroxycezymycin. AC

C₁₄H₂₁NO₁₄S 459.384

Mucopolysaccharides containing D-Glucuronic acid and sulphated N-Acetyl-D-galactosamine. MW = 20,000-50,000. Polymeric. Minimum formula given. Type A (illus.) is the 4-sulfate and type C is the 6-sulfate. Main source human cartilage and aorta (type A), heart valves (type C). Component of the heparinoid danaparoid. Used in the treatment of ischaemic heart disease, osteoporosis and hyperlipidaemias. Also used as an adjunct to ocular surgery. Shows antiviral activity against tobacco mosaic virus. [α]_D -26 (H₂O) (type A). [α]_D -12 (H₂O) (type B).
